· calculation process for the Body colour feature: Decision Tree classification for Body colows;

spi) calculate Entropy for Body colasi Assuming the dataset distribution for Body cooks;

· Black: 2 Yes, 2NO (Total:4)

· White: 3 yes, I No (Tortal: 4)

· Boown: 3 res, 3NO (Total:6)

1) Plack:

Entropy ((Black) = - (= 1092 = += 1082=). = - (= 1082 - 1 + 1082 - 100 - 100

2) white:

ENTROPY (Swhite) = - (3/10/23+1/10/24)=0.81

3) Booton:

Extropy (SBrown) = - (3/10/23+3/10/23)=1.0

step 2) calculate weighted Entropy for Body COIDIN The total counts for each Body colows:

1) Total Black :4

2) Total white: 4

3) Total Brown 86

Compute the weighted Entropy:

weighted Entropy (colows): 4x60+4+4x0.81+6x1.0

-4+3-24+6 -1324 20.95

Step3) Calculate information Gain for Rody colour using the overrall entropy calculated preveisouly (20.95)

Gain (s, COIONOI) = Entropy (s) - weighted Entropy (colour) -0.98-0.95 20.03

Final Step: Determine Bert Split

·Size of Animal - information Gain ×0.06

· Body Colons = Information Gain \$20.03

Best Split: Since the feature with the highest information gain is size of Animal (0.06). this will be selected as the first split in the decision tree. 17-1 calculate we gitted tot 30py -les footy

Illustrate Naive Bayes on the dataset to predict whether we can pet an animal or not. Find P(xily) for each xi in X we can pet an animal or not calculations must be demonstrated. I each yj in Y. see on the dataset do predict whether we can Illustrate during bree on the dataset do predict whether we can pet an animal or not and all the entropy calculations pet an animal or not and all the entropy calculations must be demonstrated in the assignment

	Animale	Size of Animal	Body Color	Can we pet
5. NO		Nudium	Black	Yer
0	Dog	The same of the sa	white	No
1	Dog	Big		4
2	Rat	Small	White	tur
3	Cow	Brig	White	Yer
4	Cow	small	Britis Brown	Ne
5	Cow	Big	Black	Yer
6	Rat	Big	Brown	No
7	Dog	Small	Brown	Yer
8	Dog	Judicum	Brown	YEN
9	Boy Cow	Midium	White	No
10	Dog	small	Black	Yer
11	Rat	Medium	Black	No No
12	Rat	Ismall	Brown	NO
13	COW	Big	Wrate	107

Natur Bayls Roudiction

Total Example: 14

count of yes: 8 (P(Yes))

count of No : 8 (P(No))

$$P(Veo) = \frac{8}{14} = \frac{4}{7} = 0.57$$

$$P(No) = \frac{6}{14} = \frac{3}{7} = 0.43$$

size of shimal: somall = 3

Medium = 3

Big = 2.

Body color:

Black = 2

Whilt = 3

Brown = 3

Size of Animal:

Small = 2

Medium = 1

Big = 3

Body Colon:

Block = 2 Whit = 1

Brown = 3

For Size of Animal.

P (Amall | Yes) = 3 P (Medium | Yes)=3

P(Big) Yes) = 2

P (small | No) = 2 P (Mudium) No) = 1 P (Big | No) = 3

· For Body color:

P (Black I Yes) = 2

P (white I Yes) = 3

P (Brown Yes) = 3

P (Black | No) = 2

P(White | No) = 1

P (Brown (No) = 3

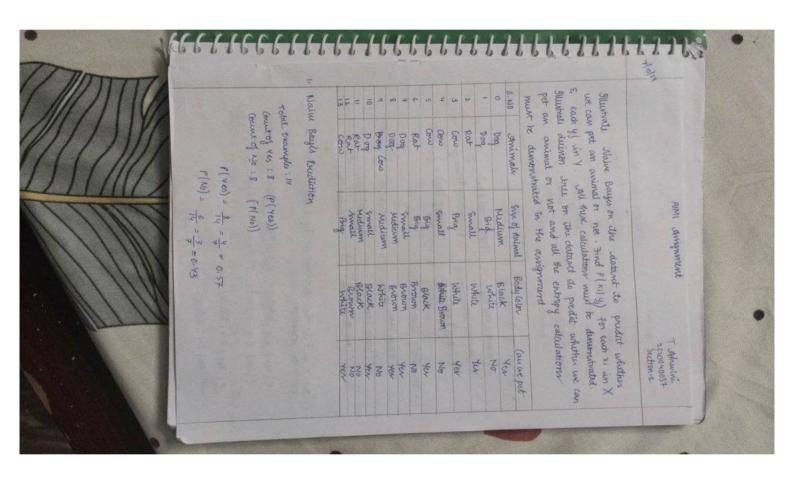

For a new animal dencibes as Big & White, calculate the posterior potabilities.

P(Yes) Big, whiti) = P(Big/Yes) x P(White I Yes) x P(Yes)

P(Nol Big, white) = P(Big | No) x P(White | No) x P(No)

P(yes | Big, White) = (2) x (3) x/4)

P(No | Big, white) = (3) x (1) x (3)

= 5 x 0.970 + 4 x 0.811 + 5 x 0.970

= 0.346 + 0.231 + 0.346

= 0.923

Step 4. Calculate Imparmation gain for Size of Animal.

Gain (s, size) = Entropy (s) - weighted Entropy (size)

= 0.98 - 0.923

= 0.057

Decimon I vec clarification

Entropy (3) =
$$-\left(\frac{8}{14}\log_2\frac{8}{14} + \frac{6}{14}\log_2\frac{6}{14}\right)$$

Step 2: For Stax of Animal.

$$= -\left(\frac{3}{5}\log_2\frac{2}{5} + \frac{2}{5}\log_2\frac{2}{5}\right)$$

$$\approx 0.970$$

$$= -\left(\frac{3}{4} \log_2 \frac{8}{4} + \frac{1}{4} \log_2 \frac{1}{4}\right)$$

$$= 0.81$$

Entropy (SBIg) =
$$-\left(\frac{2^{2}}{5}\log_{2}\frac{2}{5} + \frac{3}{5}\log_{2}\frac{2}{5}\right)$$

$$= -(0.4 \times -1.322 + 0.6 \times 0.736)$$

$$= 0.970$$
